

HiveOS 6.1r6b Release Notes

Release Version: HiveOS 6.1r6b

For information about HiveOS 6.1r6a, see the [HiveOS 6.1r6a and HiveManager 6.1r6a Release Notes](#).

Platforms: AP320 and AP340

Release Date: January 5, 2015

These are the release notes for HiveOS 6.1r6b firmware.

Although HiveOS 3.4r4 was the last release for the HiveAP 20 series, HiveManager 6.1r6b can continue to manage all Aerohive platforms. However, you must push full configuration updates to them because some commands have been removed, which would cause delta configuration updates to fail. HiveManager can support full and delta configuration updates to APs, BRs, and SR series devices running HiveOS 5.0, 5.1, 6.0, and 6.1.

Known Issues

There are no known issues at the time of the HiveOS 6.1r6b release.

Addressed Issues

The following issue was addressed in the HiveOS 6.1r6b.

Addressed Issues in HiveOS 6.1r6b

HiveOS vulnerability to CVE-2014-3566 (aka "POODLE") has been addressed in this release. For more details, see <http://www.aerohive.com/support/security-center/security-bulletins/psa-cve-2014-3566-poodle>.
